

Project Proposal Submission Guide

A professional section-by-section framework for preparing project proposals for Tamil Virtual Academy (TVA).

How to use this guide

Use the numbered sections as the proposal structure. Replace each prompt with project-specific information, dates, owners, evidence, and commitments. Keep assumptions and exclusions explicit; do not leave template guidance in the final proposal.

PROPOSAL SECTIONS

01	Introduction
02	Work Management
03	Methodology / Architecture
04	Project Team Organization
05	Development Environment
06	Standards, Conventions and Guidelines
07	Assumptions, Dependencies and Constraints
08	Risk Management
09	Monitoring, Controlling and Reporting
10	Acceptance Criteria

01

Introduction

Set the context for the proposed software product and give the reader a concise map of the proposal.

1.1 Purpose of the Proposal

Explain why the proposed product is needed, what need it addresses, and how it is relevant to public use.

1.2 Overview of the Developer

Describe the developer organization: size, management team, relevant capabilities, and experience needed to deliver the project.

1.3 Background of the Project Proposal

Summarize the product or project background, its objectives, and its nature: product development, research, prototype, or proof of concept.

1.4 Scope of the Project

Define product scope and the Software Engineering Life Cycle activities to be performed. State warranty and maintenance duration, assumptions, supported environments, and explicit exclusions.

Make the scope verifiable

List what will be delivered and what will not. Name target operating systems and versions, test environments, and any limits that affect the commitment.

02

Work Management

Show how the work will be planned, reviewed, and delivered in stages.

2.1 Stages and Deliverables

Define the project plan and management approach. Functional requirements should be clear, and each stage should specify entry and exit criteria, inputs, outputs, and reviews.

For every stage, describe the following:

- **2.1.1 Stage:** activities, milestones, quality checkpoints, and review or sign-off points.
- **2.1.2 Project Deliverables:** items delivered to TVA, delivery dates and locations, required quantities, and clear inclusion and exclusion lists.
- **2.1.3 Duration:** estimated duration for every phase and activity.
- **2.1.4 Resources:** people, tools, systems, and other resources required at each stage.

03

Methodology / Architecture

Describe the proposed development methodology and the architectural framework. Explain how the architecture supports the product requirements and delivery approach.

Include enough detail to review

Identify the major components, interfaces, data flows, and technology choices. Explain any important trade-offs or constraints relevant to TVA.

04

Project Team Organization

Identify every organizational unit that participates in project work and explain its responsibilities and interfaces.

- Show the team structure in a clear hierarchy or organization chart.
- Define responsibilities for the vendor and Tamil Virtual Academy (TVA).
- Identify other vendors or subcontractors and state their responsibilities.
- Explain reporting relationships, review roles, and how teams coordinate; distinguish direct and indirect reporting where relevant.

05

Development Environment

Specify the technical and organizational environment used to build, convert, test, deploy, and run the product.

AREA	WHAT TO SPECIFY
Systems & platforms	Computing systems and target runtime environment, including supported operating systems and versions.
People & methods	Team structure, development and conversion methodologies, techniques, and methods.
Technology	Programming languages, internal and external tools, and other technical dependencies.

Distinguish the development environment from the environment in which the finished product will be used.

06

Standards, Conventions and Guidelines

Identify the company or project standards that will govern each activity. Point to manuals or policies where details are documented, and list any deviations with reasons.

Consider standards for requirements, design, coding, testing, documentation, security, accessibility, and release management where they apply.

07

Assumptions, Dependencies and Constraints

State the assumptions on which the project is based, the external or internal issues it depends on, and the constraints under which the project will be conducted. Keep this section focused on the project as a whole.

For each item, identify its owner or source, impact if it changes, and how it will be tracked.

08

Risk Management

Identify and assess project risks. Where possible, define how risks will be monitored and what contingency actions will be taken.

RISK AREA	QUESTIONS TO ADDRESS
Technology	Are technologies, integrations, platforms, or skills unproven or unavailable?
Schedule	Which milestones depend on external decisions, resources, or approvals?
Size & complexity	Could product size, migration, or integration complexity affect delivery?
Requirements change	How will changes be assessed, approved, and reflected in schedule or scope?

A useful risk entry includes likelihood, impact, owner, early warning indicator, mitigation, and contingency.

Risk response

Assign an owner to every high-priority risk, agree on a review cadence, and record the trigger and contingency action before the risk occurs.

09

Monitoring, Controlling and Reporting

Define how the vendor and TVA will monitor progress against the work schedule and make decisions throughout the project.

- Reporting mechanisms, report formats, and reporting frequency.
- The procedure for requesting, reviewing, and approving changes to the work schedule.
- Information flows between teams, review and audit mechanisms, and escalation paths.

10

Acceptance Criteria

State the objective criteria TVA will use to evaluate and accept the delivered software product.

- Evaluation procedure, responsibilities, and evidence required for acceptance.
- Software and hardware environments, test data, and resources used in evaluation.
- Acceptance schedule, warranty and maintenance terms, and the approval process.

Approval

Acceptance criteria must be reviewed and approved by Tamil Virtual Academy (TVA). Make each criterion measurable and link it to a requirement or deliverable.

SUBMISSION READINESS

CHECK	READY WHEN
Scope	Deliverables, exclusions, assumptions, environments, warranty, and maintenance are explicit.
Plan	Stages have estimates, resources, milestones, inputs, outputs, and review criteria.
Accountability	Vendor, TVA, team, and subcontractor responsibilities and reporting lines are clear.
Acceptance	Product evaluation and TVA approval criteria are measurable and agreed.
